Summary

Computer engineering student who has already delivered client-facing AI software in production. Led a two-engineer team that shipped four AI tools to a community bank, cutting one workflow from 30 minutes to 5 and grounding an LLM assistant in source policy to satisfy federal regulatory review. Python, SQL, and REST API integration, with requirements gathered directly from executive stakeholders. Open to travel and relocation.

Technical Skills

Languages: Python, SQL, C, C++, Java, ARM Assembly, MATLAB, Verilog

AI & Data: Retrieval-augmented generation (RAG), LLM application development, PyTorch, pandas, data analysis, workflow automation, Excel modeling

Engineering: REST API integration, relational and GIS databases, requirements gathering, validation testing, edge-case analysis, Git, Linux

Client-Facing: Stakeholder scoping, cross-functional delivery, technical translation for non-technical audiences, regulatory constraint analysis

Experience

AI Implementation Lead, Apex Bank

May 2026 – Aug 2026

- Deployed 4 AI tools at a community bank as lead of a 2-engineer team, by gathering requirements directly from executive stakeholders and owning scope across the full development lifecycle.
- Cut payment-processing call handling 83%, from 30 minutes to 5, by building a Python tool and driving it through edge-case resolution and validation testing before release.
- Removed black-box compliance risk by building a retrieval-augmented generation (RAG) assistant that grounded 100% of employee answers in bank policy, meeting federal guidance against unexplainable models.
- Kept a non-technical leadership team aligned through delivery by translating technical constraints into written requirements and scoping decisions.

Engineering Intern, Knoxville Utilities Board

Apr 2026 – Present

- Eliminated manual data entry from recurring reports via Python automations on the Smartsheet REST API and pandas.
- Resolved fiber serviceability questions for customer addresses by querying GIS databases and returning results to sales and engineering teams.
- Answered data requests escalated from senior management by building Python and Excel analyses that turned raw operational data into decision-ready output.
- Prevented rework by reviewing contractor distribution designs against specification before construction.

Projects

Multi-Sensor Reaction Game Firmware, TI Tiva C (TM4C123, ARM Cortex-M4F)

- Eliminated false input detections across 4 sensor channels by applying a 20-sample sliding-window moving average filter to noisy ADC data.
- Set detection thresholds tolerant of environmental drift by characterizing thermistor and photoresistor response across varying ambient light and temperature.

Tetris on FPGA, Verilog on Xilinx Artix-7

- Shipped a playable real-time Tetris implementation on a Xilinx Artix-7 FPGA by writing synthesizable Verilog state machines and a VGA timing controller.
- Verified the design before hardware bring-up by simulating each module against testbench stimulus, then debugged the integrated system in Vivado.

Education

University of Tennessee, Knoxville, Bachelor of Science in Computer Engineering

May 2027

- GPA: 3.45 Completing 9 credit hours of graduate engineering coursework reserved toward an M.S.
- **Coursework:** Algorithms and Data Structures, Embedded Systems, Digital Logic Design, VLSI, Circuit Analysis
- **Honors:** Cook Grand Challenge Honors; Dean's List; Hope, Volunteer, and GAMS Scholarships
